

# [Sammelthread] MacOS Monterey 12.x DEV-Beta Erfahrungen

Beitrag von „spacepilot3000“ vom 13. Mai 2022, 15:11

[Zitat von fabiosun](#)

[spacepilot3000](#) It seems a similar error many MSI x570 board have from first 12.x Monterey betas..

but for your rig is weird to see that error

I updated to OC 0.8.1 without change. I found a user with a problem with bootarg dk\_e1000=0. Tried to delete my setting, also no change...

Is it possible to delete the macos installer partition showing up in OC? I started all this with the beta - now I did the update to RC and rebooted. I am unsure what version is stored in the installer disk now... I like to start over to be sure...

Update:

First positive step.

After removing SMCAMDProcessor.kext, I now get much further in boot. Now it crashes later 😊  
Too fast to see. But after rebooting to 12.3.1 now the system reloads the 12.4 update. I wait, boot, and will report.

It WAS SMCAMDProcessor.kext. I had to remove it, boot, reload 12.4 update - start over, aaaaand booted to 12.4! The golden hint came from the insanleymac forum. Thanks, guys from the "german corner".

Update to update:

Bluetooth and hibernate now dead 😞

Sorry guys. I have a run: Update, Update, Update:

I searched my a\*\* off. And found it. There was a terrible error in my manual USB map for AMD.

I have a corasir commander to block (because it shows up as UPS). The port was marked as 255 (internal bluetooth device). I deleted the USB port to disable it. Now UPS is gone, and bluetooth is working. And sleep, too. What a ride. I finally got the error.....
