

macOS 13 VENTURA beta

Beitrag von „Wolle62“ vom 12. Juni 2022, 18:59

So, das Firmwareproblem ist gelöst. Ventura läuft auf Kaby-Lake Gigabyte GA-H110M-S2H / CI5 7500 IGFX

Hier bei Insanelymac fand ich es:

Zitat

To all people that encountered the "A required firmware update could not be installed" issue:

After cross examining several config.plist files I realized the key factor that was missing from my configs is the set of string "run-efi-updater=No" which only was present at: 7C436110-AB2A-4BBB-A880-FE41995C9F82 entry under the NVRAM section.

After taking a closer look at [@pico_joe](#)'s config I realized in his config the "run-efi-updater=No" was also available in the NVRAM under "4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14" and "4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102" so I added these values to my original config which I was using for Monterey and earlier versions of macOS, updated the kexts and OC to latest version (0.8.2) and the installer went smoothly without any issues.

I just finished the installation of Ventura with these settings being added to the config.plist and I will try once more without these stings just to prove my conclusion and share the results.

Thanks to all the OC devs and all the people that helped to resolve this issue.

Alles anzeigen

Nun muss ich noch ein Audioproblem lösen. HDMI Ton ist da, der Rest fehlt noch...

UND:

Ich kann den automatischen Ruhezustand in der Systemsteuerung nicht ausschalten. Da gibt

es keinen Menüpunkt mehr?

Und automatische Anmeldung eines Users ist auch nicht mehr? Immer erst Passwort eingeben?
Puh
