

# macOS 13 VENTURA beta

**Beitrag von „fabiosun“ vom 13. Juni 2022, 12:09**

with latest commit of Opencore (082) happens sometimes I have a black screen with signal before Opencore menu

I solve this behaviour entering in bios boot selection and choosing an EFI with Opencore 081, resetting Nvram and rebooting with OC 082 all is working well again.

I do know how debug this in a better way or if it is only a user problem!
