

Clover Configurator problem

Beitrag von „fabiosun“ vom 26. Juli 2022, 11:57

from this link instead you can see some option we can use in clover given by Clover main dev (@slice)

<https://www.insanelymac.com/forums/page/7/#comment-2740755>

After kernel and boot patches there is the below:
1. OS accounts them as normal and name "kernel" in the place of name of boot. Clover has different section for kernel patches, kext patches and booter (Bootkit) patches.
2. Clover boot only with 64 bit arch while OS has "kext" parameter.
Other fields are:

OpenCore	Clover
Boot	Procedure
Comment	Comment
Count	Count
Enabled	Enabled
Skip	Skip
StartOfPartition	Boot
Find	Find
Host	HostEnd
HostStart	HostStart
HostLocation	HostLocation
HostKernel	-
HostKernel	-
-	Kernel
-	KernelPatch
-	KernelPatch

So, only saving with clover configurator app we have a huge problem in config.plist

Config.plist loose two main parameters (supported from clover bootloader)

skip

count

this happens from year with this app

Without polemics but only for a good information
