

Hilfe - habe meinen OpenCore zerschossen

Beitrag von „fabiosun“ vom 16. August 2022, 10:52

problem you have had with Catalina OS was caused from this :

Kernel	Dictionary	7 key/value p
> Add	Array	6 ordered obj
> Block	Array	1 ordered obj
Emulate	Dictionary	5 key/value p
Cpuid1Data	Data	0 bytes
Cpuid1Mask	Data	0 bytes
DummyPowerManagement	Boolean	NO
MaxKernel	String	
MinKernel	String	
> Force	Array	0 ordered obj
> Patch	Array	17 ordered obj

happy you have solved

I think you are using a debug OpenCore version with target set to 67 to expose a debug log file

you can disable verbose line with this attached config, but I suggest you to change your OpenCore with a non debug version
