Hacintosh - Ryzen 5950X - MSI Meg Unify X570 + AMD GPU (?)

Beitrag von „Enaske“ vom 23. August 2022, 14:47

[fabiosun](#)

exactly.

The system, to the left, is my current System I am running. The Idea behind everything was, to swap the 3080 for an AMD GPU, to run Hacintosh. So I save a lot of money. (Otherwise I would have bough a Mac M1 Max Notebook)

I'm not sure tho, how much performance I'm going to lose, if I swap a daily 3080 for an AMD 6900XT (since the 6950 XT seems not supported?)

Is there any negative impact in using Big Sur compared to Monterey? And how does my CPU limit anything right now?

PS: The Clover setting and everything is a pure placeholder, I had a hackintosh running a long time ago, but I am pretty much a pure noob.

PS²: To be exact about my Goal:

Having Dual Boot. Mac + Windows 10/11 (at some point)

Windows is installed on the M2 SSD, build into the PC.

For MAC, I want to create a partition on my Samsung EVO 860 SSD ~ 256 GB (Don't need much more) - Maybe 512 GB and install Mac on that SSD. So Mac gonna run on a SATA - SSD.
