As [Hecatomb](#) said AMD CPU works perfectly with macOS Ventura beta 5

I see in your signature you use an old OpenCore boot loader (080)

You have to update it and also all your kext

You have also to check if you have in your Kernel/Patches config.plist section latest release of them (in Ventura you have to insert an old patch named ***algrey - _cpuid_set_generic_info - Disable check to allow leaf7 - 13.0***)

Hm. I tried with and without the patch now. I get stuck at "EXITBS:START" 1 second after boot. Monterey works fine. OC and all kexts "new". Ideas?
