Thanks for the quick reply! Does it make more sense to buy an Intel CPU so that I can use the "bare metal" variant without having to patch the AMD CPU Kernel? Is there performance loss on the AMD CPU and would there also be the same performance loss on Intel CPUs?

What components can I choose to reduce performance loss? I try to aim for the easiest solution on the software side - I can buy whatever hardware seems to be the most reliable. Is it ever necessary to patch Software like the Adobe Suite if I use Intel CPU?

Do you think my mainboard will work well with both "Bare Metal" and VM ? And would you recommend using an external WiFi adapter or is it not that complicated to get Wifi working directly on my motherboard?
