this one is completely new one and not an update of your posted in originate post

check if you have in your Bios 4G on and CSM off

I can install, but normally working ethernet and motherboard related kexts do not work.

Ventura:

None of the EFI files I tried went through the installation.

this a problem for some ethernet in Ventura OSX no more supported

and why you put in CPU kernel patches 08 instead of 06?

if you have a 3600x it has 6 cores or your signature is not updated and you have a 3800x?

added a config of a 6 cores CPU
