

macOS Ventura Install Help

Beitrag von „fabiosun“ vom 2. September 2022, 16:10

try to use my latest EFI and on it change only the config.plist I have posted alone (it is correct for your core numbers)

It could also be possible that your MSI motherboard is the culprit

Some users also with cpu of 3XXX series must downgrade their bios to have Ventura and Monterey working perfectly

try my EFI and post where it hangs (remember to change in it and put this config:

<https://www.hackintosh-forum.de/198551-config-plist-zip/>

By the way

Your GPU (RX6600) is supported only from Monterey 12.1 OSX or greater

Some ethernet (integrated in some motherboard could loose support in OSX in latest Monterey or Ventura OSXs)
