

# Radeon HD 7790 1 GB hardware GPU Beschleunigung aktivieren

Beitrag von „OSX-Einsteiger“ vom 14. September 2022, 19:30

[Davide](#)

Versuch es mal mit dieser Variante HD 7790 und da zu diese boot-args

boot-args	Description
agdpmod=spkera	Used for disabling board ID checks on some Navi GPUs (RX 5000 & 6000 series), without this you'll get a black screen. Don't use if you don't have Navi (ie. Polaris and Vega cards shouldn't use this)
-radcodec	Used for allowing officially unsupported AMD GPUs (spoofed) to use the Hardware Video Encoder
radbg=15	Used for disabling some power-gating modes, helpful for properly initializing AMD Cape Verde based GPUs
unfairgvar1	Used for fixing hardware DRM support on supported AMD GPUs
nvidia_drm_ver=1	Used for enabling NVIDIA's Web Drivers on Maxwell and Pascal cards in macOS Sierra and High Sierra
-wegnoegpu	Used for disabling all other GPUs than the integrated Intel iGPU, useful for those wanting to run newer versions of macOS where their dGPU isn't supported

Leider kann ich zu dieser Kombination nix da zu sagen wegen fehlenden Desktop und so .
