

AQ-107C unter macOS Monterey 12.3

Beitrag von „kaneske“ vom 20. September 2022, 22:40

I had (the 107 is still in use) both in my Intel Rig and i can confirm the issue was also freezing OS since 12.3 Beta X(I think this version, maybe 12.3 GM).

Both cards were functional (OS without freeze when getting linked to switch) when AppleVTD was functional and DisableIOMapper was false.

So the X540-T cards are affected too...which driver (Subsystem ID Hack) loaded seems equal. I tested Sonnet and SmallTree on that Card, which had the same result—> freeze on Link.
