

# Ivy-Bridge Installation {gelöst auf ivy-bridge installation {noch OC 0..6.9}}

**Beitrag von „mutterhunt“ vom 29. September 2022, 18:25**

Just took the -pikera flag [boot](#) args. It's something like the "neuveau" in linux. Turn down the animations a bit and it does fluently, have running up the Monterey 10.6.

It's a processor question (just an Ivy Bridge) and i5, but they didn't drop support for mac18,2 in SMBIOS. a quirk maybe is to be set, and install.log does not contain the memory footprint of the addresses given before rebooting (damn hell to fast to read).
