Denke es hat etwas mit deiner eGPU zu tun. Welches SMBIOS verwendest du? Habe folgendes gefunden:

You need to disable the IGPU in the Bios when running Ventura. You then need to use a SMBIOS from a system that doesn't use an IGPU and only uses the AMD dGPU for graphics processing. That means you have to use the iMacPro1,1 or the MacPro7,1 as the MacPro6,1 (Trashcan) has also been dropped from Ventura. This is similar to how most AMD systems need to be configured, i.e. no IGPU, so must rely on the discrete GPU.
