Yes this EFI Works for my Monterey 12.1 But the System doesn't run very well since Apple ID etc does Not work.

this is your EFI updated with latest opencore and kext

backup yours and try to see if it boots your Monterey 12.1 installed OS

I have disabled some kext and if it works we should try to optimise your bootarg

About Apple Services , maybe your SMBios or id was blacklisted from apple..or probably it is an ethernet enX problem..with an updated and working EFI we could try to understand and maybe solve that problem
