

AMD Radeon 6650 XT, 6950 XT und 6900 XTXH ohne GPU-ID Spoofing

Beitrag von „hObelware“ vom 6. April 2023, 15:43

I usually don't care about benchmark scores at all. Additionally (from what I read) they may vary from OS Version to OS Version ..

Are the scores better when using spoofing? I didn't test that, but I believe there shouldn't be a big difference, since my kext utilizes the very same drivers as spoofing does.

For the time being, I use spoofing, since I ran into VDADecoder issues after upgrading to 13.3 .. my next step will be, to implement the rx 6650 support as driver extension .dext (as intended by apple), maybe that will solve DRM Decoding .. but I'm rather short on spare time right now, so I can't predict, when exactly I will be able to do something about that.
