

In Arbeit HP ProBook 650 G1

Beitrag von „benos23“ vom 22. April 2023, 14:36

Here is a full Working EFI for the Probook 650 g1. MAKE SURE TO ADD APPROPRIATED KEXT FOR WIFI AND BLUETOOTH.. IF YOU'RE USING AN INTEL CARD, I SUGGEST YOU TO USE AirportIntel.kext from GitHub (<https://github.com/OpenIntelWireless/itlwm/releases>)for your OSX version. MAKE SURE TO MODIFY THE SMBIOS TOO.

Current SMBIOS is MacBookPro12,1 which is fully compatible with Monterey.

It works well on Ventura but you'll have to use the OClegacypatcher tool to fix the HD4600 with [SIP](#) disabled in Recovery and modify the smbios to a Ventura compatible one. By my side I'm not using Ventura cause some app stops working once I disabled the [SIP](#).

Ps: I didn't add wifi and Bluetooth kext cause the EFI file exceed the maximum size accepted.
