Dell Vostro 3558 mit OpenCore & macOS Ventura

Beitrag von „Nio82" vom 15. Juni 2023, 19:26

Hello [darthwilson](#)

Yes I have finally got everything working on the Dell Vostro 3558. As [apfel-baum](#) wrote it, I also followed the instructions of Dortania. I also advise you to do this, the learning process is very helpful if you have to adjust something later. You can also take a look at my OpenCore Config which I posted above. But you have to modify the Config for your notebook in any case. Change SMBIOS & driver Kext for WLAN/Bluetooth etc. I replaced the original Intel WiFi card with a Broadcom one on my Vostro. If you want I can also tell you the apps I used.

P.S. But don't expect the Dell Vostro to be a rocket. I only made it a Hackintosh for the fun of tinkering.

Please also write the hardware info of your computer either in your user profile, or like me in your signature. Then other users don't have to search for it when they help you. And when you start with your hacki project, make a separate topic for it.
