

# Dell Vostro 3558 mit OpenCore & macOS Ventura

Beitrag von „Nio82“ vom 15. Juni 2023, 21:20

[darthwilson](#)

You can also start right away with Ventura.

The configuration with OpenCore is no different than with Monterey. You only have to do 2 things additionally. When you have generated the SMBIOS for "MacbookPro 2015" & enter it in the Config.plist, you name it as MBP14.1 or newer, instead of MBP12.1. And you have to install after the macOS installation, the missing graphics drivers for the Intel graphics with OpenCore Legacy Patcher. Like it used to be on Windows.

That's all.

For your understanding. On modern "Hackintosh" you do not in fact make any changes to the OS directly on the hard drive. Virtually all modifications are in the OpenCore bootloader & are applied on the fly at boot time. When you change something in your configuration, you do it in/on OpenCore.
