[Dr-C](#) for now i did a minimal changes in your EFI

Updated kexts and opencore

You have windows and OSX mixed EFI and this is not advised for not skilled users (IMHO)

If you like, backup your complete EFI folder and then overwrite this attached EFI (only BOOT and OC folders), i don't include in this zip microsoft folder for a light zip upload(use your microsoft)

So overwrite BOOT and OC Folders and leave microsoft folder as is

Verify if in your motherboard bios there is 4G/Uefi option and set them to ON

I assume that posted EFI was working before and USB mapping that i see there have been done exactly for your motherboard and USB ports you use 😊
