

# Installationsfehler

Beitrag von „fabiosun“ vom 11. Juli 2023, 17:04

[Zitat von FireDDragon20](#)

Ich habe hier die erstellte und fertige EFI Ordner mit den nötigen dateien [EFI.zip](#)

Used this EFI to start

Some adjustment done on it (it was a pain)

- 1) acpi section used only one
- 2) bootloader and kext updated to latest release (093) (used only a minimal set of kexts you add kexts for laptop in posted EFI)
- 3) SMBIOS set to MacPro7.1
- 4) kernel patches (core count patches set for your 8 cores cpu)
- 5) Uefi Drivers set in a correct way (before it was a mess)

try to boot with this if you have created in a correct way an OSX Installer and if it hangs post a photo where system hangs

Before all these steps check if your bios is configured well (so find CSM (must be off) UEFI (ON), 4G (On) fast boot disabled

And latest thing, remember, with a little effort from you your system will be up..but GPU is not supported at all and OSX experience will not be good
