Hi gorans, You should use macbook pro 15,2

And for USB problems

You should use these tools from the masters of OpenCore or Hackintool to generate ssdt or kexts with your own map

Hi,

thanks for the input.

It wasn't a problem with USB, rather with SSDTs. I made new SSDT tables with [SSDTTime](#) and copied SSDT-PNLF and IMEI SSDT from pre-made e6420 efi. Fiddled a little with the sound but now have a working USB, sound...

I have a problem with CPU PM. I created SSDT-PM with [ssdtPRGen](#) ([instructions](#)) but when I disable Drop CpuPm and Drop Cpu0Ist from ACPI/Delete and use created ssdt-pm, processor stays at 0.8GHz. If I don't use SSDT-PM.aml and enable these two in ACPI/Delete, PM is working but cpu doesn't go over 3GHz where it should go to 3.2GHz.

When I sort this out, card reader is next. 😊

Thanks,

Goran
