Danke für den Tip, habe ich erledigt. Jetzt gibt es Kernel Panik....Noch eine Idee?

if you use macpro 7.1 and you are installing monterey or greater you have to enable this kext

AppleMCEReporterDisabler.kext

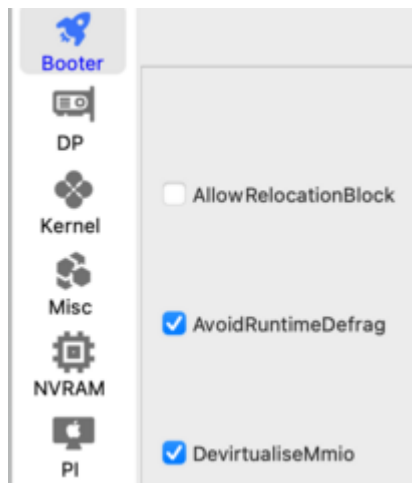

and also check the previous advice given about ACPI SSDT

EDIT:

and also these are wrong

unflag DevirtualiseMMIO booter quirk and both the ones on MMIO Whitelist

your system does no need of them

	Address	Comment	Enabled
Booter	427510000	Haswell: SD_RCSA is a 0x4 page memory region, containing SPL_BASE at 0x3000 (SPL_BASE_ADDRESS)	✓ true
DP	427810000	Generic: PCI root is a 0x1000 page memory region used by some types of firmwares	✓ true

Edit 2

attached your config with all these above modify applied

[config.plist.zip](#)
