

# MacOS Ventura Blackscreen

Beitrag von „fabiosun“ vom 11. September 2023, 15:28

This quirk is enabled and you do not need it

Devirtualizemmio (booter quirk)

edit

in your EFI (posted in your first message this quirk is OFF as it should be)

in this log it is on

```
02:332 00:017 0C: Installing KeySupport...
02:340 00:017 0CII: g5T->ConIn CB2F4550 vs found CB2F4550
02:366 00:017 AIX: Using 5 (50ms)
02:384 00:017 0CABC: ALRDL @ RTDFRG 1 DEVMMIO 1 NOSU @ NOVWHL @ NOSB @ FBSIG @ NQHMHP @ SPSLIDE 1
  WDRUPROT @
02:405 00:021 0CABC: PEXITBS @ PPRRG @ CSLIDE 1 NSLIDE @ PRGRV 1 RMAP 1 VMAP @ APPLDS @ RTPERRS 1
  ANBAR -1 RBID @
02:427 00:021 0CABC: Firmware has 4137022 free pages (797886 in lower 4 GB)
```

DEVMMIO is set to 1 (on)

i think you are using a different EFI

Edit 2

also this part seems wrong

```
20:327 00:013 0C: Starting OpenCore...
20:340 00:013 0C: Found previous image, aborting
20:354 00:013 0C: Failed to start image - Already started
20:368 00:013 BS: Failed to start OpenCore image - Already started
```

check if your system has others "working EFi" in your disks
