

macOS Installation auf einem Lenovo Thinkpad T490S

Beitrag von „apfel-baum“ vom 10. Dezember 2023, 01:54

hello [breexly](#) ,

there is a problem in general, the git efi is borked .

take a look at this pic- all kext have no version number

it would be a good moment for now, to read the dortania guide, maybe let yourself inspire by this efi folder, but create an efi by yourself-

- <https://dortania.github.io/OpenCore-Install-Guide/>
- <https://dortania.github.io/OpenCore-Install-Guide/op.plist/coffee-lake.html>

tools to edit the config.plist -under releases

- opencore auxiliary tools-
- <https://github.com/ic005k/OCAuxiliaryTools>
- an plist editor-

- <https://github.com/ic005k/Xplist>

answer to "3"

of course is there actually no way to have a 100 % match of the apple services- without an corresponding card- it's a hackintosh not a real mac-

because apple does not use intel wlan/bt hardware, so it would be recommend to use a still supported broadcom chipset which is used in an current or former apple product.

greetings
