

Anfrage zu HWC: ASUS Prime Z-390A

Beitrag von „MooVit“ vom 10. Januar 2024, 21:20

Hello. I hope I am not violating the rules of this forum by posting the following.

I've had a working hackintosh on Mac OS Mojave for several years. Once upon a time I assembled the Clover bootloader. Now I have a great need to work in Ventura OS. My configuration is simple:

ASUS PRIME Z390-A

i9 9900k

Integrated Intel UHD Graphics 630.

I rebuilt the EFI folder and the config file using those published in this topic as a basis. I use the [Bios settings](#) as in this topic, only in the graphics section I turned on the "Auto" mode, and not "PCIe". And in the configuration file I changed the settings for the integrated graphics according to Dortania's manual.

I made a bootable USB flash drive. I bought and installed a separate nvme m2 disk for Ventura OS.

However, when I boot from a bootable USB flash drive and select "Install Ventura" in the opencore menu, after some boot time I get a monitor that turns off.

Please check my EFI folder. Where did I go wrong?

P.S. It's also probably worth adding that I updated the BIOS version for ASUS PRIME Z390-A to version 2004.

P.P.S. I want to clarify that I used the recommendations from this post:

[Asus Prime Z390-A](#)
