Der bringt nichts, ist für APUs mit Vega iGPU.

it works also with my rx 6950xt (nootRx)

I doubt his laptop will work, but as I said he has to adjust cpu related kernel patches

EDIT:

Efi posted by [xpkiller](#) (Hecatomb one) is not good for you (patches but also other reason like ethernet kext)

WIFI could be a big problem in your laptop, and an ethernet solution to install could be a better choice (if your laptop has one)

Opencore and kexts used are old (if you like to try macOS Ventura or Sonoma OS)

How have you build your OSX installer?

I repeat my self it could be an "impossible mission" but i f you have time to try could be also fun if you would have success
