Dankeschön. Dann habe ich jetzt 2 Möglichkeiten am Samstag was zu probieren.

You are trying to install this GPU on a real Mac Pro 3.1

You have to flash your GPU with a little tool you can find in [mac rumors](#) forum

Without it no screen for rx6600/6650 gpu on a real mac

then, if you succeed to this task you can install OSX Monterey (this is a limitation for old Mac Pro 3,1,4,1,5,1 computer because their CPU lack of some important instructions)

If you succeed in these two task, you can use your GPU using kext quoted above or only spoofing your gpu to a 6600 one (you can do this in your Device Properties) config.plist section)

\* you need a GPU cable from mac motherboard to GPU (2 mini 6 pin to 8 pin)
