

Ryzen 5 5600 MSI Radeon 6650 XT Gigabayte B550-A Gaming Sonoma Probleme

Beitrag von „fabiosun“ vom 5. März 2024, 17:12

[aedm](#) you need a kext and a bootarg to have your Ethernet working:

[AppleIntel210Ethernet.kext.zip](#)

then:

 3 boot-args String e1000=0

in short you have to use and put an old OSX ethernet kext and e1000=0 in your config.plist proper section

 AppleIntel210Ethernet.kext 10.0 true ContaminatePlist: 0x00000000-00000000-00000000-00000000

if yiu are lucky your ethernet will work only with these two modifies

If it is not working you may have the need to spoof your ethernt card to a supported one (some motherboards need of this)

EDIT

As said by [greecedrummer](#) user Ethernet is not an Intel (so all my assertions could be deleted)
