

AMD Radeon 6650 XT, 6950 XT und 6900 XTXH ohne GPU-ID Spoofing

Beitrag von „mitchde“ vom 22. April 2024, 09:10

Beside the kext, you **must** have (in OpenCore config.plist) the **agdpmod=pikera** boot argument.

The screenshot shows the OpenCore config.plist editor interface. At the top, it says "config.plist - for Official OpenCore [0.9.8 Release Configuration]". Below this are three buttons: "Add", "Delete", and "LegacySchema". A table with two columns, "Key*" and "Value", is displayed. The "boot-args" key is highlighted in blue and contains the value: "-wegnoigpu keepsyms=1 debug=0x100 agdpmod=pikera watchdog=0 -lilubetaall -amfipassbeta". Other keys include ForceDisplayRotationInEFI (0), SystemAudioVolume (46), csr-active-config (27F00000), prev-lang:kbd (de:0), and run-efi-updater (No).

Key*	Value
ForceDisplayRotationInEFI	0
SystemAudioVolume	46
boot-args	-wegnoigpu keepsyms=1 debug=0x100 agdpmod=pikera watchdog=0 -lilubetaall -amfipassbeta
csr-active-config	27F00000
prev-lang:kbd	de:0
run-efi-updater	No

If you come from non AMD gpu card this boot argument may be missed. Than also black screen.

last but not least - use not Whatevergreen kext together with the NOOTRX.kext!!!

Only one of them - and as an last try use both but load NOOTRX.kext **before** WEG kext. Before means NOOTRX.Kext is before WEG.kext in the OC config.plist(If you use OCLP for orig. macs that also uses OC config.plist) .
