

# AMD Radeon 6650 XT, 6950 XT und 6900 XTXH ohne GPU-ID Spoofing

Beitrag von „hObelware“ vom 22. April 2024, 11:29

[mitchde](#) .. agdpmmod=pikera will simply have no effect at all, if WhateverGreen.kext is not used (because this is implemented there) ..

NootRX.kext implements the same modification to AppleGraphicsDisplayPolicy as WhateverGreen.kext does, but only when iMacPro1,1 SMBIOS is used. if you want to run that, you should need nothing but NootRX.kext.

if you want to run another SMBIOS (e.g. some iMac, which uses IGPU and dGPU, or MacMini) then make sure NootRX.kext is loaded prior to WhateverGreen.kext in config.plist and everthing should work as intended. you run into a dependency problem, as NootRX.kext will not work with several values modified by WhateverGreen, which results in a kernel panic if you load these kexts the other way around. when using WhateverGreen.kext agdpmmod=pikera is mandatory as well, as their initiaization process reverts the modification NootRX.kext did to AppleGraphicsDisplayPolicy.
