# Ich habe errors Und habe keine Ahnung ._____. (AMD)

## Beitrag von „fabiosun" vom 11. Mai 2024, 18:28

ciao Niloc

there are some incorrected things in your EFI

Patches for cores count are good if you are installing sonoma (only latest of them is useful for sonoma) and you can check seeing in min max kernel config plist of those patches

Booter quirk are wrong for your platform (you do not need of DevirtualizeMMIO quirk so disable it)

Your asus should have 4G option in your bios

Enable it (disable CSM)

Delete ncpi=0x3000 bootarg

disable SSDT-CPUR as said by other user

A kext is missing (realtek one) and you are using also intelmausi for ethernet (check which model you have and then choose the right one)

Nootered not useful for you but if you like to use it disable whatevergreen kext

try to do these modifies from yourself and see if something good happen 🙂

EDIT

ah important thing also is to disable 2 VISUAL below

i am fighting a little war to understand with the patches provider why these two patches are enabled by default and i have no answer for now 😏

EDIT2

also SMBIOS is a bit weird 🙂
