

Secure Patch :: from 2018 to 2024

Beitrag von „Full-R“ vom 13. Mai 2024, 18:20

From the scratch is to simple to say.

Loose all data and memory and return some experience from 2010 to 2024.

Thanks, community. I found all I loose there and recover it.

Simply run fix.command.

From the scratch and nuclear hell-graveyard to EVO for the life.

Think about create when possible new interface for filtering packets, kernel settings UI\UX and HackServeX configure interface because I need to run my projects cleanly.

With very difficulty I found MacBook Air 2010 early and that's helps to recover all I'm loose. Not be a worry: after that I'm have to port it to ARM to EVO hardware in server meaning(something like a MacOS installer with applications and futures like a Windows PE recovery software).
