

HP Elitebook Folio 1040 G2

Beitrag von „Arkturus“ vom 12. Juni 2024, 16:03

es geht immer noch um Monterey und die EFI aus dem Eröffnungsthread?

Monterey unterstützt Broadwell, insoweit wundert mich das Verhalten.

Welche Hardware CPU/iGPU?

versuche mal die config.plist und überprüfe die BIOS-Einstellungen

Disable

- Fast Boot
- Secure Boot
- Serial/COM Port
- Parallel Port
- VT-d (can be enabled if you set `DisableIoMapper` to YES)
- Compatibility Support Module (CSM) (**Must be off in most cases, GPU errors/stalls like gIO are common when this option is enabled**)
- Thunderbolt(For initial install, as Thunderbolt can cause issues if not setup correctly)
- Intel SGX
- Intel Platform Trust
- CFG Lock (MSR 0xE2 write protection)(**This must be off, if you can't find the option then enable `AppleXcpmCfgLock` under Kernel -> Quirks. Your hack will not boot with CFG-Lock enabled**)
 - For 10.10 and older, you'll need to enable `AppleCpuPmCfgLock` as well

Enable

- VT-x
- Above 4G Decoding
- Hyper-Threading
- Execute Disable Bit
- EHCI/XHCI Hand-off

- OS type: Windows 8.1/10 UEFI Mode (some motherboards may require "Other OS" instead)
- [DVMT](#) Pre-Allocated(iGPU Memory): 64MB or higher
- SATA Mode: AHCI
