Interest in Ozmosis

Beitrag von „hyux1" vom 3. Juli 2024, 20:23

You can't boot Monterey. The current version is able to boot Catalina without an external kernel patcher. If someone with the appropriate knowledge would help, newer macos versions would also be usable. However, there is still a lack of developers who are able and willing to do so.

This ozmosis version has new features, unlike old versions like 167X-MASS. This includes, among other things, that you can edit the settings of the Defaults.plist in the BIOS, similar to how you can overclock a cpu.
