It can be integrated into the BIOS.

Sometimes. With more recent macos versions you need more kext and space.

The space of the most bios chips is to small.

Even when OZM was the hot new shit often you had to put the ethernet drivers in S/L/E or in your efi.

So no benefit over open core.

Zitat

It's easier to use.

When all the work is done for you as written so many times.

When you have to learn how to extract OZM from other firmwares and build your own bios (and also brick your BIOS chip)

Then following an easy step by step guide which doesn't roast your hardware ist much easier.

Or is desoldering a bios chip from your motherboard and reprogram and then solder it back to the board "easier"?

Zitat

It can boot macos directly from the BIOS.

Woho you gain ~6s a year.

I normally reboot my mac only for macos updates so 5-10 times a year.

Otherwise the mac sleeps.

Zitat

Changing and reinstalling the hard drive is easier.

???

Opencore on usbstick?

Ever heard of usb thumb drives?

Or just use the EFI of the hard drive.

Also opencore can easily handle linux, windows, macos. bsd on one drive which doesn't work with ozm in 80% of the time due to the included patched DSDT.

Zitat

You can directly make settings for the boot options in the BIOS.

Can also be done in OZM

Zitat

NVRAM reset can be done immediately after switching on.

ok again you lose 1-3 Seconds of time in opencore.

How often do you need to reset.

[sarcasm on]

You also can reset the NVRAM without turning on the pc by removing the battery and power plug

[sarcasm off]

Hotkeys most similar to mac.

most is not true.

because ozm uses the SAME hotkeys as apple.

opencore uses the SAME hotkeys as apple.
