

File package for Ozmosis

Beitrag von „pupokass“ vom 7. August 2024, 14:07

Updated package: GUIDs of some files have been corrected, kexts have been updated, file system drivers have been updated, a theme has been added, OzmosisDefaults.plist with updated SMBIOS iMac14.4 has been added to OzmosisDefaults.plist, an option to disable the built-in AptioFix has been added, as well as an option to configure your own framebuffer for the Intel video card (if you have a Sandy Bridge processor, you need to replace "AAPL, ig-platform-id" with "AAPL, snb_platform_id") to calculate the framebuffer for Ozmosis, you need to generate it in Clover configurator, copy all the characters after 0x and paste them into [this](#) calculator, insert the numbers that came out into the value AAPL, ig-platform-id, OpenRuntime has been replaced with OpenRuntimeFtw, quirks are set in it for ivy bridge, if you need to configure quirks, insert OpenRuntimeFtw in ROM click on the arrows on the left and find "Raw Section" click on this inscription with the right mouse button and click "Extract body" enter the name OpenRuntimeFtw.raw then open it in ProperTree or other similar programs then edit this file and save NECESSARILY check that the file has the extension .raw then click "replace body" and everything is ready, and also a package with compressed files was added. I also attach the kext2ffs utility in order to convert OzmosisDefaults from plist to ffs.
