mmmh it is the one i use i cant say if it needs some permission

however i see you are using Algrey fix pat patch

to improve performance in OpenCL/GL you can disable it and use the Shanees one

for now if you cant do good resubt with DP or with SSDT you can try also with NootRX kext and see the differences

in Opencl your system should have a result greater than 100000 as you see in my picture above

i have tried to modify your config.plist

use also the kext attached (backup yours first)

in this config i use DP properties with your path

removed pikera from bootarg

used Shanee fix patch

Alles anzeigen

Unfortunately, the EFI doesn't work. Still no Hardware-Acceleration. But I've not modified your EFI. Just added my SMBIOS.

Hi,

I have an MSI GAMING TRIO Z with a 6900 XTXH. I currently only use device-properties with device-id BF730000. Runs great. Metal Scores around 265k.

Damn. Something's terrible wrong with my config. You are using WhateverGreen right?
