Hackintosh nicht funktionell, startet nicht

Beitrag von „fabiosun" vom 20. September 2024, 16:08

[griven](#) it seems a bit different from the one you gave him

first user uses some kext for intel BT and Amfipass kext (usefull if user has OCLP installed to patch Fenvi)

Also ethernet kext are weird

User has two of them and one of them should have a bootarg like E1000=0 that i cant see in posted EFI

Also AppleALC and AppleALCU, in Sequoia on AMD system dont work for now (and i think only the first one should be declared in config.plist)

I will check better the other parts of this EFI

EDIT

also booter / quirk are wrong for his platform

EDIT two i see also a macos installer on 3) what is that?
