Sequoia OSX?

your system doesnt need of DevirtualizeMMIO booter quirk

if you are trying to install system older than sequoia you have to modify also some Core count patches

NootRx kext is good for your GPU but maybe you have to modify also your SMBios to imacPro 1.1

i would also to try to disable NOOTRX kext during first installation steps and use SSDT-Plug for your cpu/system

EDIT

Disable parallel and serial port from your motherboard bios
