Installationsprobleme Gigabyte GA-EX58-UD5

Beitrag von „thommel“ vom 18. Oktober 2013, 23:10

Hallo TuRock,

Die DSDT.aml Datei ist nur im Extraordner des Bootsticks.

Die org.chameleon.boot.plist habe ich vom Bootstick in den Extraordner auf dem Rechner kopiert.

A screenshot of a text editor window with a dark background and light text. The code is XML plist format. The window has a title bar with standard macOS window controls (red, yellow, green buttons) and a search icon. The code content is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
  <key>AtiConfig</key>
  <string>Vervet</string>
  <key>PciRoot</key>
  <string>1</string>
  <key>GraphicsEnabler</key>
  <string>Yes</string>
  <key>Graphics Mode</key>
  <string>1024x768x32</string>
  <key>GraphicsEnabler</key>
  <string>Yes</string>
  <key>Kernel</key>
  <string>mach_kernel</string>
  <key>Kernel Flags</key>
  <string></string>
  <key>Timeout</key>
  <string>5</string>
  <key>UseKernelCache</key>
  <string>No</string>
</dict>
</plist>
```

wo muss ich die beiden Kext hinkopieren.

Thomas
