`Erledigt` Multibeast Installation Failed [English]

Beitrag von „neoyoli" vom 19. Dezember 2015, 22:53

I tired to add the audio kexts with Multibeast 8.01, but the helper installation failed.

Here is the Multibeast log:

Code

1. 12/19/15 22:12:58 - Starting MultiBeast 8.0.1-20151119
2. 12/19/15 22:13:20 - Mounting EFI
3. 12/19/15 22:13:20 - Mounting EFI failed. Exiting.

SIP is disabled (csrutil status - system Integrity Protection status: disabled.)
EFI mounts with EFI Mounter without problem.

I tried to clean the cache, delete all Multibeast files and reinstall, but same thing happens.

What do you think?

Could you please check the FileSystem of your EFI Partition?
use the Terminal command

Code

1. Diskutil list

to find the Device Identifier of your EFI-Partition, then use

Code

1. diskutil info /dev/YourDeviceIdentifieroftheEFIPartition (e.g. /dev/disk0s1)

There should come up the infos
File System Personality:
Name (bundle):
Name (User Visible):

Sorry, I forgot...
You have to mount the EFI-Partition with

Code

1. disktuil mount /dev/disk0s1

before the other command can show the File System Information.
Could you please check again?

Beitrag von „neoyoli" vom 20. Dezember 2015, 01:17

Code

1. File System Personality: MS-DOS FAT32
2. Type (Bundle): msdos
3. Name (User Visible): MS-DOS (FAT32)

Beitrag von „al6042" vom 20. Dezember 2015, 01:27

ok, in that case your EFI seems to be ok...

I guess you should ask the guys from the tomato-Website about their tool...
On the other hand you can use pacifist and extract the necessary packages to install them without the Multibeast Framework.

Beitrag von „neoyoli" vom 20. Dezember 2015, 01:32

Thanks for the tips, I will crush this bug once and for all! 🙂

UPDATE: I extracted the audio package, but the install still fails 😲

This is what the log says:

Code

1. 20/12/15 09:33:15,335 UserEventAgent[231]: com.apple.TMHelperAgent.SetupOffer enabled
2. 20/12/15 09:33:15,335 UserEventAgent[43]: Failed to send message because the port couldn't be created.
3. 20/12/15 09:33:15,501 Installer[683]: The Installer encountered an error that caused the installation to fail. Contact the software manufacturer for assistance.

and the install log.txt

UPDATE II: It turned out from the log, the FakeSMC kexts and plugins didn't have dependencies (I must have messed it up in the beginning somehow), deleted them, and the packages extracted from Multibeast, installed fine.

However the friggin' audio still doesn't work, it cuts after seconds!
