

ASUS R9 280X

Beitrag von „LRous“ vom 15. September 2016, 07:28

Guys tell me how to do makeup that was displayed on "my computer" video card is not as 7xxx, but as a R9 280X.

You need to provide a proper Framebuffer to get it displayed correctly try Hamachi or Futomaki as Framebuffer.

Your card is based on the AMD "Tahiti" chip which was first used in the AMD 7970. So both cards share the same DevcielD and OSX uses the name for the older card. This doesn't affect performance.
