Asmedia 1042 sleep fix

Beitrag von „AceWeal“ vom 9. April 2017, 10:17

Hello friends, please give me advice

Asmedia 1042 after going out of sleep no longer work, if not restart, how to fix it?

i am use GenericUSBXHCI.kext

Beitrag von „al6042“ vom 9. April 2017, 10:50

Hi, please send an IOREG file of your machine, so I can determine where the AS 1042 Chip is located.

With that information I can add it to the DSDT and hopefully can help you.

To create a IOREG file you must download the [IORegistryExplorer](#).

Open the app and then just use "File"->"Save as" and save the contents as .IOREG-file.

Zip the resulting file and post it as attachment.

This is about your Asus P8Z77m Pro?

Where did you get this funny looking DSDT which misses most of the important information

and pointing the Asmedia 1042 to "Device (RP05)" while IOREG shows it under "Device (RP07)".

I remember creating a DSDT for you on March 17th...

This contains all Asmedia-Details already...

- RP07 for Asmedia 1042 USB
- RP08 for Asmedia SATA

Why don't you use that DSDT, which is attached to this post again?

Please use the functions "Inject", "Add ClockID" and "FixOwnership" in your config.plist.
You find those under "Devices"->"USB"

This work in my config

Beitrag von „al6042“ vom 9. April 2017, 12:24

Maybe it is somehow connected to the fact that GenericUSBXHCI wasn't maintained since December 2015 and therefore might have issues with the newest Sierra release.

Beitrag von „AceWeal“ vom 9. April 2017, 12:28

I think so too=)
