Imessage and Face Time in Ozmosis

Beitrag von „Pietra“ vom 1. Mai 2017, 17:22

How to insert values to activate Imessage and Face Time in Ozomis Bootloader ..?

Beitrag von „kuckkuck“ vom 1. Mai 2017, 18:23

You need to write a defaults.plist and put it into the folder EFI/Oz in your EFI. Templates can be found here: <https://www.hackintosh-forum.de/OzmosisDefaults-Vorlagen/>
But remember, you need to change the injected values with values from CloverConfigurator for example. You can also modify and generate a defaults.plist with the OzmosisToolbox from our download center. [Auslesen der Ozmosis-Parameter](#)

How to convert the FakeSCM kexts and other kexts to add these kexts in Bios Ozmosis?

Beitrag von „kuckkuck“ vom 1. Mai 2017, 20:45

With kexttofs and afterwards add it with UEFI Tool. Your questions are somehow out of order and the last one a little off topic 😊 What happened with the imessage thingy?

How to remove ozmosis from bios on the motherboard? How to make the motherboard back to normal after you have installed the ozmosis ..

Beitrag von „al6042“ vom 2. Mai 2017, 21:56

Just reflash to a stock BIOS for your mainboard.

Beitrag von „jboeren“ vom 2. Mai 2017, 21:57

By simple flashing the original bios and set [bios settings](#) to default.

We already told you, that you can get rid of Ozmosis by simply reflash the BIOS with the original file from the board manufacturer...

There is no other way to "remove" Ozmosis.

What kexsts do you need to use in ozmosis?

Your question does not make any sense...

It would be easier if would try to explain your intentions, instead of asking incoherent questions...

With that information helping you will just be easier, I guess.
