{Gelöst} Gigabyte Rev1.1 Z77P-D3 encounter problems Audio and Network don't work

Beitrag von „visin“ vom 2. Januar 2018, 07:11

I have a piece of Gigabyte Rev1.1 Z77P-D3

My motherboard is Rev1.1, installed Z77PD3_Rev_1_1_HighSierra, the system is 10.13.2, but the sound card and network card can not work.

I come from China, English is poor. I am using Google Translate now, I hope you will understand. Now you can normally enter the system, but the sound card and network card can not identify, I need to do?

Audio is Realtek ALC887

Network is RTL 8168/8111 Or Atheros AR8151

Looking forward to your help

PS AtherosL1cEthernet-1.2.3.zip and Oz-AppleHDA-ALC887.zip to
EFi/Oz/Darwin/Extensions/Common not work.
Also need DSDT.aml?

Welcome to Hackintosh Forum. 😄

Added the necessary AppleALC and Lilu and AtherosE2200Ethernet Kexts for your setup ...
www.hackintosh-forum.de/index...7P-D3-encounter-problems/ ... Nr. 9 from 'al6042' and put in

your EFI/Clover/Kexts/Other and reboot.

Thank you for your reply, I use ozmosis, not clover

Beitrag von „derHackfan“ vom 2. Januar 2018, 07:59

Dann eben unter EFI/Oz/Darwin/Extensions/Common ablegen und Neustart machen. 😄

AppleALC-ozm.kext !!!
Lilu.kext
Ethernet.kext

Can you provide the download address? I am not familiar with this side. thanks

Beitrag von „derHackfan“ vom 2. Januar 2018, 08:23

Aber sicher doch ... 😄

[Zitat von derHackfan](#)

Aber sicher doch ... 😄

Normal work
Thank you very much

Please rephrase your question in english.

Also please add your hardware details either in your signature or your profile, within the section "About me"...

Don't forget to mention the type of bootloader you're using...

Thank you... 😄
