Install mojave Z77-D3h - USB ports

Beitrag von „supergg12“ vom 29. November 2018, 11:41

Hello friends,

Please begin to excuse my bad English.

I recently installed the mojave rom and the corresponding osx.

However, I noticed that when starting the bios, I have to turn off the usb printer or unplug the usb port disks to allow booting.

How to solve this problem ?

Thank you in advance for your contribution.

Cordially.

supergg

[supergg12](#): If you have plugged an external USB-HDD with XFS-Filesystem then your machine will not boot. I have the same problem with "My Book" from Western Digital. I have to unplug the external HDD on every boot and reboot. The only suggestion for you is another Filesystem. I believe that the type of partition make sense, too.

Excuse my bad english, please. I left school in 1980. 😊

Have a nice day and best regards

from Steffen aka bluebyte

Hello bluebyte,

Thank you very much for your quick response.

However I failed to indicate that this is an [ozmosis installation](#) of mojave

Regarding the problem of USB ports, the big problem is mainly a printer that I must turn off if I want the boot to succeed.

What do you think ?

Thanks again !

Supergg

Note: if you speak a little French it would be great!
