## Clover bootloader

### Beitrag von „xzAtlas“ vom 6. Oktober 2019, 08:58

I'm going through the process of doing this for my first time on a laptop that i have no regrets destroying of it doesn't work im trying to install mojave in the hopes i can use xcode but currently I've hit my first roadblock

I'm using virtualbox to make my bootable USB and so far I've successfully put it through MRB and it has mojave on it and ready to go im now looking at it in clover and I've mounted the USB stick/Disk so i can access the EFI partition to add my EFI folder however now im currently trying to install the Clover EFI bootloader and when choosing my installation destination the USB Drive/Disk isn't part of the list of drives it can be installed on as a matter of fact its not even on the list so im not sure what to do it appears in my disk utility's and also in the Clover configuration so why not in the bootloader any help would be appreciated thank you

How did you create the USB-Stick? Did you use a tool like TINU?

---

### Beitrag von „xzAtlas“ vom 6. Oktober 2019, 13:35

i used this tool as directed in the video

<https://www.insanelymac.com/fo...hfs-firmware-check-patch/>

I have been following this tutorial <https://youtu.be/VdRSYogDygs>

and up until the 7:20 mark its gone perfectly but in the menu where he's selecting the drive to install the clover bootloader, the newly made USB isn't appearing for me

If i do understand your problem, you`re stuck at mounting the EFI partition on the USB (shown in the video at 6:00 minutes).

You`re working in a VM - can it access the USB?

As you started out with "insanelymac", why do you ask in a german forum and not the guys at "insanelymac"?

[Zitat von g-force](#)

You`re working in a VM - can it access the USB?

Correct [g-force](#) , you have to connect the pendrive to the VM [xzAtlas](#)

---

### Beitrag von „xzAtlas“ vom 6. Oktober 2019, 16:30

the VM can access the USB as i made the USB within the virtual machine, but the part im stuck on is not mounting the USB as i can successfully mount it with no problems my issue is the step right after that for installing the EFI into the EFI partition as when i go to follow his steps it doesn't show the USB in the list of drives i can install the EFI contents into using the installation

As for the support side of things as this is my first time i wasn't exactly sure how else to get support on the matter so I simply googled it and you guys here where the top rated support

option for hackintosh support, The only time I've used 'insanelymac' was simply for downloading the tool

Try this. Pull the Pendrive and connect it again to an USB Port. Then again try to connect it to the VM. In the VM open Terminal, type diskutil list and have a look if the pendrive is listet.

---

### Beitrag von „xzAtlas“ vom 7. Oktober 2019, 03:05

so I've done as you have said i checked using 'diskutil list' and even through that its coming up its still appearing in clover configurator and it can still be mounted to access the EFI partition but it still won't appear in the bootloader installer i have provided pictures to show that's its in the clover config and disk util but not in the clover bootloader installer

```

/dev/disk1 (external, physical):
#:          TYPE NAME          SIZE  IDENTIFIER
0:          GUID_partition_scheme  +16.0 GB  disk1
1:          EFI EFI            209.7 MB  disk1s1
2:          Apple_HFS           15.7 GB  disk1s2

```

### Beitrag von „karacho“ vom 7. Oktober 2019, 06:43

Hm, that's strange. Which OS you use? I guess you're on Windows. Try this, it's much easier. [http://cvad-mac.narod.ru/index/bootdiskutility\\_exe/0-5](http://cvad-mac.narod.ru/index/bootdiskutility_exe/0-5) and read the manual before.

### Beitrag von „g-force“ vom 7. Oktober 2019, 09:11

Because it's only a VM, you can install Clover everywhere you want. Just remember where the folder is and copy it later into the EFI-partition of the USB.

### Beitrag von „xzAtlas“ vom 8. Oktober 2019, 04:58

[karacho](#) i use windows 10 on the laptop and if i can't manage to get this working ill try that method thank you for your help

[g-force](#) thanks for that tip the only issue with that is my VM is only running Mac OS sierra and

upon attempting to install the efi onto that drive im presented with a message that reads something along the lines of "not compatible however you can try but doing so may break the system" so im hesitant but if its only going to break the VM that's not really a problem i suppose

@Admin Kann jemand den Post #12 von [walla](#) mal in einen eigenen Thread abtrennen?

---

### **Beitrag von „al6042“ vom 24. Oktober 2019, 22:26**

Ist erledigt und findet sich nun unter [High Sierra auf einem Haswell](#)
