

Installing the MAC will reboot the PC

Beitrag von „Macko“ vom 7. April 2020, 20:14

I updated the BIOS. After updating the BIOS, the MAC installation starts and immediately restarts the PC. I tried the new Lila text, WhateverGreen, but nothing helps. The [BIOS settings](#) are recommended for MAC installation. I'm putting my EFI from USB, please help me what i got wrong. I have a GIGABYTE GA-B150N Phoenix-WIFI motherboard. Installing MAC I got the original from Apple's latest version, Clover I have the one I put in the attachment - without [distro...](#)

Thank you all for your help.

[al6042](#) guckst du mal hier, das war doch vorhin der Kandidat mit dem DistroKext

Der andere Kext ändert ja nix daran dass er trotzdem (vermutlich) mit einer [Distro](#) arbeitet

Beitrag von „al6042“ vom 7. April 2020, 20:34

Stimmt... habe ich schon gesehen, aber in seiner EFI ist der Kext nicht mehr drinnen.

Da es aber aktuell ein Problem mit den englischen Forenregeln gibt, war zu erwarten, dass er einen neuen Thread eröffnet.

Aber ich habe das auf dem Schirm und brauche keinen Hilfs-Sheriff... 😊

Beitrag von „al6042“ vom 7. April 2020, 20:39

[Macko](#)

As you might have recognized, there is still an issue with your build.

Since we don't really know if you have any more additional kexts in your system, supporting your install might won't work.

In that case I have an complete EFI-folder for you to test.

Make sure you rename your current EFI-folder to EFI-old, before your copy the contents of attached ZIP-file onto your EFI partition.

Beitrag von „Macko“ vom 7. April 2020, 20:52

Heureka! al6042 you are God.

The installation has already started. But I can't do the mouse.

Maybe you need to insert PS2 kext ??

But super thank you for your help al6042 - super forum 🙌👉👈

Beitrag von „al6042“ vom 7. April 2020, 20:56

That depends if you have an PS2 Mouse attached... that is something we also don't know...

If that's the case, use the VoodooPS2Controller.kext from your old EFI-folder and put it in the folder /EFI/CLOVER/kexts/Other, where you will find all the other necessary kexts.

Be aware:

I also switched your SMBIOS from an old iMac14,2, which is not a good choice with your hardware, to an iMac17,1.

You should check all the Apple services and try to login to them.

Beitrag von „Macko“ vom 8. April 2020, 09:56

So I'm done, wireless mouse doesn't work. The cable mouse also does not work. VoodooPS2Controller kext didn't help. I plugged the mouse into USB3 and USB2 - no result. The keyboard is OK.

al6042, I don't know what kext to put there anymore ..

Here is my EFI which you gave me, plus there is also VoodooPS2Controller kext.

Please, is there any other possibility? Thanks in advance

Beitrag von „svenatkins“ vom 8. April 2020, 11:48

did you define your USB ports with Hackintool?

Beitrag von „Macko“ vom 8. April 2020, 12:04

[svenatkins](#), no, because I can't install Catalina.

But USBInjectAll.kext is in installation ..

Beitrag von „al6042“ vom 8. April 2020, 21:47

Rename your file to "config-old.plist" and try the attached file instead.

Beitrag von „Macko“ vom 9. April 2020, 05:38

Excellent, now it's complete. Thank you again al6042

Beitrag von „al6042“ vom 9. April 2020, 07:47

you're welcome, but no...

It's not complete...

As [svenatkins](#) mentioned, you should create your own dedicated USB next.

Within the application HackinTool you will find an english manual on how to achieve that.
