

Switch from Ozmosis to OpenCore?

Beitrag von „poof“ vom 12. Juni 2020, 14:13

Hello Hackintoshers!

Currently I'm running MacOS High Sierra with my custom Ozmosis Bios on my Gigabyte Z97X-UD5H-BK motherboard and Mac15,1 i7-4790k Haswell compatible CPU. I'm very happy because everything works (iMessage, Sound and even Sleep!). I haven't switched to Catalina yet because Apple and Nvidia aren't friends anymore, but I will when I buy an AMD graphics card.

If I transfer all my Ozmosis default.plist settings to OpenCore, will I be guaranteed everything will keep working?

Or are they different in a way that might influence this?

Maybe you think I should migrate to OpenCore even on High Sierra? Is this easy to do?

Thank you!

Sorry for not writing in German, I can read it though so replying in German is fine for me 😊

Hello [poof](#),

as long as you make sure that all critical values (SN,MLB,HWID,ROM) stay consistent across the change anything should work like it did before 😊

Cheers Griven
